

Exp - 1

→ ~~Array~~ nums $nums[i]$ is a integer between 0 and 9.

Triangular sum:-

- If $n=1$ end
- Else create new Array $n-1$
 $newNums[i] = (nums[i] + nums[i+1]) \% 10$
- Replace $nums = newNums$
- Repeat

Return triangular sum.

Example 1:- $nums = 2, 2, 3, 4, 5$

Output = 8

1, 2, 3, 4, 5

3, 5, 7, 9

8, 2, 6

0, 8

8

→ Approach:-

Simulate the process until one element remains

→ Code:-

```
while (nums.size() > 1) {  
    vector<int> temp;  
    for (int i = 0; i < nums.size(); i++) {  
        temp.push_back((nums[i] + nums[i+1]) % 10);  
    }  
    nums = temp;  
}
```
